

Malaria is a parasitic infection transmitted by the bite of a certain type of mosquito. In extremely rare cases people can get malaria from coming in contact with infected blood. This disease affects millions of people each year and can be found in over 90 countries worldwide. Though travelers to areas where malaria is present often take medicines before, during and after their trip, these medicines do not always work. In addition, it is important to note that a person can be infected and still remain symptom free. Currently, donated blood is not tested for malaria. Thus, it is very important that we question all donors as to **WHERE and WHEN** they traveled. Travelers to “at risk” areas are required to refrain from donating blood for specified periods in order to minimize the risk of transmitting malaria through a blood transfusion.

When questioning the donor about malarial travel, **the following information is required:**

1. The name of the country
2. **ALL** specific areas (region and/or city) visited, if less than 12 months from departure
3. The amount of time spent in the malaria endemic country
4. The date the donor left the malaria endemic country

**NOTE: If the name of the city or region in a specific country is not listed or is unclear after review of the criteria, have the Person-in-Charge/Designee consult the Regional Collections manager or Special Donor Services (SDS) for clarification. If unable to obtain clarification, defer the donor for the length of time required for malarial travel. Explain to the donor that he/she is deferred. Give him/her the reason for deferral with instructions to call SDS the next business day. SDS can help determine the donor’s eligibility status and remove any deferral as appropriate.**

COUNTRY	MALARIA RISK	NOTE
Afghanistan	Yes	All areas at risk.
Albania	No	
Algeria	No	
Samoa, American (U.S.)	No	
Andorra	No	
Angola	Yes	All areas at risk.
Anguilla (U.K.)	No	
Antarctica	No	
Antigua and Barbuda	No	
Argentina	No	
Armenia	No
